INCLUSION DELIVERABLE — LEARNER PARTNER PERSONA

Project: Schoolify Academy
Track: Mastercard Foundation EdTech Fellowship Morocco
Format: One-Page Deliverable

BY: Ayoub Ait El Maalem

— 1. WHO THEY ARE

Yassine, 16 years old, lives in **Sidi Moumen, Casablanca**. He is a 1st-year Baccalaureate student (public school branch) who speaks Moroccan Darija at home with friends, and takes his scientific classes in French. Diagnosed with dyslexia and moderate dyspraxia two years ago, he lives with his parents and two younger siblings; his father is an independent mechanic and his mother manages the household.

— 2. BARRIERS THEY CUMULATE

- **Specific Learning Disability (SLD):** Formal diagnosis of dyslexia + developmental dyspraxia (fine motor control struggles and visual crowding).
- **No school accommodations:** Attends an overcrowded public high school class (41 students) where teachers provide zero adapted pedagogical materials or extra exam time.
- **Out-of-pocket speech therapy stopped:** Had 8 sessions of orthophonie in 2024, discontinued because the family could no longer afford 250 MAD/session with no CNSS reimbursement coverage.
- **Linguistic overload:** Instructional materials switch abruptly between standard written Arabic and French textbook jargon, triggering visual fatigue and reading blocks within 10 minutes.
- **Hardware sharing & instability:** Does not own a personal computer; relies on an entry-level Android smartphone shared with his sister.
- **Digital isolation:** Avoids written discussion boards or peer WhatsApp groups out of severe embarrassment over persistent spelling and typing errors.

— 3. HOW THEY LEARN / ACCESS CONTENT TODAY

- **Device:** Entry-level Infinix Smart 7 smartphone (2 GB RAM, cracked screen protector, micro-USB charger) shared with his younger sister.
- **Connectivity & data:** Prepaid mobile data (*Pass 3 recharge of 20 MAD / 2 GB per week*); home ADSL is absent, so data is rationed strictly for WhatsApp homework sheets and brief YouTube searches.
- **Who helps them:** His maternal cousin (a university student) visits on Saturday afternoons to read through French handouts out loud; his parents cannot read French or parse technical instructions.
- **Language:** Daily audio interactions in Darija; school handouts in technical French; textbooks in Standard Arabic.
- **Time — how much, and when:** ~40 minutes in the late evening (after 21:30), when his younger siblings are asleep and his sister hands over the phone.

— 4. WHAT MY PRODUCT DOES NOT SERVE FOR THEM (The Honest Gap)

1. **Unformatted dense typography causes visual crowding:** Our course interfaces and quiz questions display in standard, tight-spaced system fonts (Inter / Roboto, 14px) with high-contrast pure white backgrounds (`#FFFFFF`), causing severe visual stress, word-skipping, and abandonment within the first 3 questions.
2. **Mandatory rapid-fire text input and timed mechanics:** Our platform quizzes require either manual typing of keywords or fast single-touch clicks under rigid countdown timers, directly penalizing his motor coordination (dyspraxia) and resulting in repeated fail states before he can fully process the question.
3. **Absence of voice playback or bilingual audio scaffolding:** Every single question, explanation, and error prompt is served strictly as written text in French; we do not provide a text-to-speech toggle or Darija audio voiceovers, forcing him to copy-paste snippets into external apps to understand why an answer was wrong.
4. **Data-heavy media assets trigger drop-offs:** Our current video lessons and media components stream uncompressed via CDN at ~35 MB per short clip, consuming his weekly mobile bundle within two modules and blocking continued practice.

— 5. MOROCCO CONTEXT THAT SHAPES THEM

- **Diagnostic desert and financial strain:** Fewer than 15% of Moroccan public school students with specific learning disabilities receive formal diagnosis or specialized follow-up due to a nationwide shortage of licensed orthophonistes (mostly concentrated in private Casablanca/Rabat clinics).

- **Absence of systemic public adaptation:** While Framework Law 51-17 references inclusive education (*Éducation Inclusive*), operational accommodations (adapted fonts, oral evaluation, tiers-temps) remain largely unapplied in standard secondary classrooms.
- **Prepaid data reality:** Over 94% of internet connections in Morocco are mobile-based (ANRT), and lower-income suburban households rely almost entirely on weekly micro-recharges (*Pass *3 / 6*), making data-heavy web apps prohibitive for daily self-study.

+ BOX A — ACTIVATABLE ACCESS NETWORK

Association Maroc Dys (Casablanca / Oasis): An established Moroccan association supporting children and youth with dyslexia and dyspraxia, located 25 minutes from our Technopark office, with weekly parent-learner support sessions and an active network of over 120 local families.

+ BOX B — CURB-CUT EFFECT

When we add audio-first question playback, dyslexia-friendly high-legibility fonts (OpenDyslexic / Lexie Readable), and generous touch tap-targets, we quietly solve navigation and fatigue for every working student accessing Schoolify on an overcrowded bus, on a cracked screen, or with low French reading fluency.

— 6. OUR HYPOTHESIS

If Schoolify Academy introduces an integrated Darija audio-read-aloud toggle, customizable high-legibility typography, and untimed touch-friendly quiz layouts, **then** Yassine will complete an entire foundational module and quiz independently without asking his cousin for reading assistance or abandoning the session.

Starting hypothesis — to be tested with a real person.
